Semiconductor industry

The **semiconductor industry** is the aggregate of companies engaged in the design and fabrication of semiconductors and semiconductor devices, such as transistors and integrated circuits. Its roots can be traced to the invention of the transistor by Shockley, Brattain, and Bardeen at Bell Labs in 1948.[1][2] Bell Labs licensed the technology for $25,000,[3] and soon many companies, including Motorola (1952),[4] Schockley Semiconductor (1955), Sylvania, Centralab, Fairchild Semiconductor and Texas Instruments were making transistors. In 1958 Jack Kilby of Texas Instruments and Robert Noyce of Fairchild independently invented the Integrated Circuit, a method of producing multiple transistors on a single "chip" of Semiconductor material. This kicked off a number of rapid advances in fabrication technology leading to the exponential growth in semiconductor device production, known as Moore's law that has persisted over the past six or so decades. The industry's annual semiconductor sales revenue has since grown to over $481 billion, as of 2018.[5]

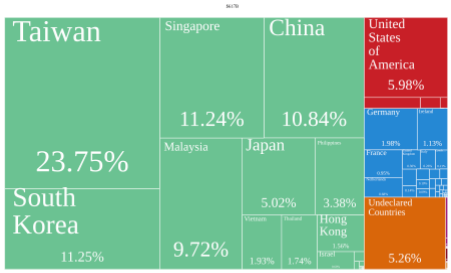
In 2010, the semiconductor industry had the highest intensity of Research & Development in the EU and ranked second after Biotechnology in the EU, United States and Japan combined.[6]

The semiconductor industry is in turn the driving force behind the wider electronics industry,[7] with annual power electronics sales of £135 billion ($216 billion) as of 2011,[8] annual consumer electronics sales expected to reach $2.9 trillion by 2020,[9] tech industry sales expected to reach $5 trillion in 2019,[10] and e-commerce with over $29 trillion in 2017.[11] In 2019, 32.4% of the semiconductor market segment was for networks and communications devices.[12]

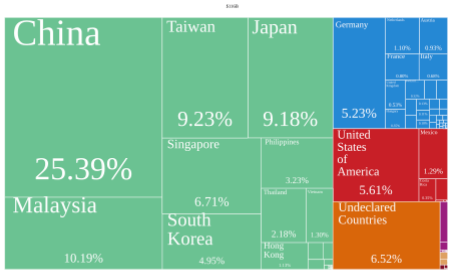
In 2021, the sales of semiconductors reached a record $555.9 billion, up 26.2%, with sales in China reaching $192.5 billion, according to the Semiconductor Industry Association. A record 1.15 trillion semiconductor units were shipped in the calendar year.[13] The semiconductor industry is projected to reach $726.73 billion by 2027.[14]

Industry structure

The global semiconductor industry is dominated by companies from the United States, Taiwan, South Korea, Japan and the Netherlands, with Israel and Germany having significant presence in the field.[15]



Electronic integrated circuit export by country or region as of 2016, by HS4 trade classification



Export of discrete semiconductors as of 2016, by United Nations Harmonized Commodity Description and Coding Systems 4

Unique features of the industry include continuous growth but in a cyclical pattern with high volatility. While the current 20-year annual average growth of the semiconductor industry is on the order of 13%, this has been accompanied by equally above-average market volatility, which can lead to significant if not dramatic cyclical swings. This has required the need for high degrees of flexibility and innovation in order to constantly adjust to the rapid pace of change in the market as many products embedding semiconductor devices often have a very short life cycle.

At the same time, the rate of constant price-performance improvement in the semiconductor industry is staggering. As a consequence, changes in the semiconductor market not only occur extremely rapidly but also anticipate changes in industries evolving at a slower pace. The semiconductor industry is widely recognized as a key driver and technology enabler for the whole electronics value chain.[16]

Prior to the 1980s, the semiconductor industry was vertically integrated. Semiconductor companies both designed and manufactured chips in their own facilities. In many cases, this included inventing new processes, refining and purifying source chemicals and silicon wafers, and even manufacturing equipment, like furnaces, lithography tools and etchers. These companies also carried out the assembly and testing of their chips. Over time, many of these functions were outsourced, such that today semiconductor manufacturers rely on a complex supply chain to provide wafers, high purity source chemicals, and processing equipment. Further, starting with LSI in 1969, the industry has seen the emergence of Fabless Semiconductor

Companies that focus solely on chip design and rely on other companies to manufacture their designs. Initially, these other companies were integrated device manufacturers (IDMs), companies that also designed and manufactured their own products, and thus were often competitors of the Fabless companies. But, by the mid-1980's TSMC and UMC emerged as foundries, specializing solely in the manufacture of other companies' designs.

Today, much of the industry is based on the foundry model, which consists of semiconductor fabrication plants (foundries) and integrated circuit design operations, each belonging to separate companies or subsidiaries. Some companies, known as integrated device manufacturers, both design and manufacture semiconductors. The foundry model has resulted in consolidation among foundries. As of 2021, only three firms are able to manufacture the most advanced semiconductors: TSMC of Taiwan, Samsung of South Korea, and Intel of the United States.[17] Part of this is due to the high capital costs of building foundries. TSMC's latest factory, capable of fabricating 3 nm process semiconductors and completed in 2020, cost $19.5 billion.[17]

Intel is considering outsourcing some production to TSMC. It currently can only produce 10 nm semiconductors, while TSMC and Samsung can both produce 5 nm.[17] GlobalFoundries, an American-headquartered firm, uses a 12 nm process for its most advanced chips due to the rapidly increasing development costs of smaller process nodes.[18]

Semiconductor sales

Sales revenue

Annual semiconductor sales (1987–2018)

Year	Revenue (nominal)	Revenue (inflation)	Ref.
2022	$601,694,000,000		[19]
2021	$594,952,000,000		
2020	$466,237,000,000		[20]
2019	$422,237,000,000		
2018	$481,090,000,000	$602,410,000,000	[5]
2017	$420,390,000,000	$539,270,000,000	[5]
2016	$345,850,000,000	$453,120,000,000	[5]
2015	$335,170,000,000	$444,620,000,000	[21]
2014	$335,840,000,000	$446,070,000,000	
2013	$305,580,000,000	$412,490,000,000	
2012	$291,560,000,000	$399,330,000,000	
2011	$299,520,000,000	$418,660,000,000	
2010	$298,320,000,000	$430,160,000,000	
2009	$226,310,000,000	$331,690,000,000	
2008	$280,000,000,000	$409,000,000,000	
2007	$255,600,000,000	$387,600,000,000	[22]
2006	$247,700,000,000	$386,400,000,000	
2005	$227,000,000,000	$365,000,000,000	[21]
2004	$213,000,000,000	$355,000,000,000	
2000	$204,000,000,000	$372,000,000,000	
1995	$144,000,000,000	$297,000,000,000	
1992	$60,000,000,000	$134,000,000,000

Major semiconductor companies

Name	Country	Manufacturer type[35]	Hardware products
Samsung Electronics	South Korea	IDM	NAND flash memory, DRAM, CMOS sensor, RF transceivers, OLED display, SSD
Intel	United States	IDM	x86-64 microprocessor, GPU, SSD, DRAM
TSMC	Taiwan	Pure-play	
SK Hynix[a]	South Korea	IDM	flash memory, DRAM, SSD, CMOS sensor
Micron[b]	United States	IDM	DRAM, NAND flash, SSD, NOR flash, Managed NAND, multichip packages
Qualcomm	United States	Fabless	RF module, digital signal processor, Snapdragon system on chip
Broadcom	United States	Fabless	Broadband/Wi-Fi/Bluetooth modems, Custom DSP & ARM CPUs
Kioxia[c]	Japan	IDM	NAND flash memory, SSD
Texas Instruments (TI)	United States	IDM	Microcontroller, SoC, DSP, Amplifiers, data converters
Analog Devices[d]	United States	IDM	Amplifiers, data converters, audio & video products, RF & microwave, sensors, MEMS
Qorvo	United States	IDM	RF module, filters, Amplifiers, PMIC
Microchip	United States	IDM	Microcontrollers and analog semiconductors
NXP	Netherlands	IDM	PMIC Media processor, MIFARE, LPC
MediaTek	Taiwan	Fabless	SoC, chipset, CPU, GPU, DSP
Infineon[e]	Germany	IDM	Microcontrollers and power semiconductor devices
Bosch	Germany	IDM	
STMicroelectronics	France/ Italy	IDM	ASIC, Microcontrollers
Sony	Japan	IDM	Active-pixel sensor, NAND flash memory
ARM	United Kingdom	Fabless	Instruction set architecture
AMD	United States	Fabless	x86-64 CPU, GPU, motherboard chipset, SDRAM
Nvidia	United States	Fabless	GPU
ON Semiconductor	United States	IDM	
UMC	Taiwan	Pure-play	

Name	Country	Manufacturer type[35]	Hardware products
Apple	United States	Fabless	Apple silicon
IBM	United States	Fabless	IBM Power microprocessors, z/Architecture
Mitsubishi Electric	Japan	IDM	Power semiconductor devices
Tower Semiconductor	Israel	IDM	
Xilinx	United States	Fabless	programmable logic device
SMIC	China	Pure-play	
Wolfspeed	United States	IDM	SiC
Nordic Semiconductor	Norway	Fabless	Bluetooth, Wifi, Low Power Cellular

Notes:

- Pure-play foundries – They specialize in foundry services. They may or may not offer design services to third parties, as well as mask (photomask) making, semiconductor packaging and testing services, which can also be outsourced to other companies. An example is TSMC, which offers design, testing and packaging services, TCE photomasks, which offers only mask making services, and ChipMOS, which offers only packaging and testing services.
- IDMs (integrated device manufacturers) – They may or may not offer foundry services.
- Fabless suppliers – They do not offer foundry services. They may or may not offer design services to third parties.

Sales

Manufacturers headquartered in the following places are the sales leaders in the pure-play foundry, IDM (integrated device manufacturing), fabless manufacturing and OSAT (outsourced semiconductor assembly and testing) sectors of the industry.[35]

Rank	Foundry	IDM	Fabless	OSAT
1	Taiwan	United States	United States	Taiwan
2	United States	South Korea	Taiwan	United States
3	China	Japan	China	China
4	South Korea	European Union	European Union	Singapore
5	Israel	Taiwan	Japan	Japan

Manufacturers headquartered in the United States have fabrication plants across the world, including over 50% in the Americas, 39% in the Asia-Pacific region (including 9% in Japan), and 9% in Europe.[35]
